

Project work report (analysis)

1) Executive summary

This project is a Next.js 15 / React 19 knowledge-driven site that turns hard policy + financial rules into conversion-focused guides, while simultaneously preparing the site for long-term authority building (E-E-A-T) and machine-readable discoverability (structured data for search engines + LLMs).

The core “work done” can be grouped into:

Extensive research synthesis (especially Sametinget and northern incentive ecosystems) into user-facing “guides” and hub pages.

A lightweight “CMS-like” expert system to power employee profiles → authorship → future articles.

Systematic SEO + structured data (FAQPage/Article/Service/Breadcrumb schemas) to improve visibility and LLM retrieval.

A set of reusable content components (FAQ, CTA, expert callouts, machine-readable data spans).

A universal Vipps setup wizard that outputs standardized config + implementation docs and enables controlled data-sharing with integration partners.

2) Sametinget research → content architecture

2.1 Research foundation (what was produced)

The Sametinget research corpus is not “notes”; it’s structured analysis designed to become web information architecture and conversion messaging.

Key research documents (examples):

Strategic grant-mechanism + budget analysis: [Research/Sametinget/Sametinget Budsjett og Tilskudd 2025-2026.pdf](Research/Sametinget/Sametinget Budsjett og Tilskudd 2025-2026.pdf:1)

Detailed 2026 financing + deadlines calendar: [Research/Sametinget/Budsjett 2026_Sametinget og søknadsfrister (1).pdf](Research/Sametinget/Budsjett 2026_Sametinget og søknadsfrister (1).pdf:1)

Language funding ecosystem analysis: [Research/Sametinget/Støtteordninger Samisk Språk 2025-2026.pdf](Research/Sametinget/Støtteordninger Samisk Språk 2025-2026.pdf:1)

Regional seed/establishment fund coverage: [Research/Sametinget/Så Korn- og etableringsfondet (Finnmark 2026–2029).pdf](Research/Sametinget/Så Korn- og etableringsfondet (Finnmark 2026–2029).pdf:1)

Wider “Tiltakssonen / Nord-Norge” fiscal opportunity map (feeds recruitment + calculators): [Research/Sametinget/Nord-Norge Bedriftsfordeler 2026 Rapport.pdf](Research/Sametinget/Nord-Norge Bedriftsfordeler 2026 Rapport.pdf:1)

A key insight from the research is that users don’t need a list of schemes; they need:

eligibility “traps” (e.g., geography mismatches),
deadlines and workflow,

reporting/compliance requirements,
and a translation layer that makes rules actionable.

2.2 How research became site structure

The knowledgebank is explicitly structured around user intent buckets (Sametinget / Bedrift / Organisasjoner). See hub page: KunnskapsbankPage().

The Sametinget area is built as a hub + sub-guides:

Sametinget hub (positioning + navigation + sources + structured data): SametingetHub()

Business support: SametingetNaeringPage()

Institutions/festivals: InstitusjonPage()

Culture/language: KulturSprakPage()

Duodji: DuodjiPage()

Reindeer husbandry: ReindriftPage()

Each page follows a recurring pattern that matches the research findings:

fast “eligibility” check (e.g., STN/geography warnings)

key numbers / thresholds

what documents and processes actually decide outcomes

pitfalls that cause rejection or repayment

CTA that turns guidance into services

3) Profiles (Employees) → future authorship → E-E-A-T

3.1 Expert model (lightweight CMS now, scalable later)

The site uses a central expert registry that behaves like a minimal CMS:

Expert interface and fields: Expert

Expert data store: experts

Retrieval helpers: getExpert()

This creates a single source of truth for:

name, role, department, contact info,

short bio (for author boxes and trust signals),

and later: an expert/profile route.

3.2 How experts are injected into content

Pages consistently fetch experts and render them in an “authority block” component:

UI component: ExpertInsight()

Examples:

Sametinget pages often use Jan-Atle as the domain expert: SametingetNaeringPage()

Bedrift/Tiltakssonen uses Ingvald as the accountant authority: TiltakssonenPage()

This is directly aligned with E-E-A-T:

Experience/Expertise: visible expert quotes + contextual advice

Authoritativeness: consistent roles and “statsautorisert regnskapsfører” framing

Trust: contact + stable company details in footer

3.3 Why this is necessary for accountants (YMYL)

Accounting/tax advice is Y-M-Y-L. The project addresses this by:

Using explicit author roles and credentials in content blocks: ExpertInsight()

Adding “quality assurance / sources” sections (Sametinget hub): SametingetHub()

Showing regulatory nuance (De Minimis, reporting, deadlines) rather than oversimplified claims (example: De Minimis warning): TiltakssonenPage()

This reduces “thin content” risk and increases trust signals that search engines/LLMs look for.

4) SEO + “search against LLMs” (Structured Data, FAQ, JSON-LD)

4.1 Pattern: human-visible FAQ + machine-readable JSON-LD

A recurring implementation pattern:

Build an FAQ array for display

Convert to JSON-LD

Inject with a script tag

Render the same FAQ via an accordion

Key building blocks:

FAQ UI: FaqAccordion()

JSON-LD injection example (Kunnskapsbank): KunnskapsbankPage()

This serves both:

classic search engines (FAQ rich results where eligible)

LLM retrieval (“the answer exists as structured Q/A pairs”)

4.2 Schema coverage: FAQPage + Article + Service + Breadcrumb

The site uses multiple schema types depending on page intent:

FAQPage

Used on Sametinget and Vipps pages for Q/A discovery: SametingetNaeringPage()

Article

Used for “analysis” content to support author/publisher signals: TiltakssonenPage()

Used for the long-form Sápmi analysis: DeepDivePremium()

Service

Used to express commercial offering connected to the guide (conversion + clarity):

KulturSprakPage()

BreadcrumbList and graph composition

Implemented via a schema graph on the Sametinget hub: SametingetHub()

4.3 “MCP-style” machine-readable data markers

Numeric and source claims are annotated with a dedicated component:

Implementation: `McpDataSpan()`

It outputs:

data-mcp-value for raw data

data-mcp-source for provenance

a build-date stamp

This is a forward-looking pattern for:

automated validation against an internal DB or external sources

LLM tooling that can “quote a value + source” reliably

5) Component system and content production flow

5.1 Reusable conversion/content components

The project deliberately uses consistent modules so new content can be built quickly and uniformly:

“Expert callout” trust block: `ExpertInsight()`

FAQ block: `FaqAccordion()`

Machine-readable data references: `McpDataSpan()`

5.2 Long-form + short-form content strategy (same topic, multiple formats)

The Sápmi “sosioøkonomiske forskjeller” topic exists in multiple presentation modes:

Short/interactive (Instagram-like): `ArtikkelFornesInteractive()`

Long/deep analysis with Article schema + author box: `DeepDivePremium()`

Index that links short vs long: `ArtikkelOversikt()`

This is important for SEO because it supports:

broad queries (short format)

high-intent/authority queries (long format)

future content clustering via internal linking

6) Vipps integration: from content → universal setup wizard

6.1 Guide page (the “why” + the flow)

The Vipps integration landing page combines:

clear benefits

an interactive setup experience

accounting-grade explanation of data flow

FAQ + schema

See: `VippsIntegrasjonsPage()`

Notably, it explains the accounting logic (1580 interim account, settlement timing, reconciliation) which is YMYL-safe and “revisorvennlig”.

6.2 Wizard as a reusable product across the site

The wizard is built as a modular step system:

Main wizard: VippsSetupWizard()

Step registry: steps

Typed config contract: WizardConfig

Config defaults: initialConfig

It is “universal” because it parameterizes:

integration partner selection: integrationPartners

module selection (products/APIs): modules

accounting system selection (PowerOffice vs 24Seven)

6.3 Output artifacts (standardized handover)

The wizard generates:

a JSON configuration (for technical integration)

a TXT implementation guide (human-readable)

and an email handoff

Core build and output logic:

Config model creation: buildConfigData()

Implementation guide generator: generateGuideText()

Guardrails for step completion: canProceed()

6.4 “Integreringsguide” control: Averdi owns the communication surface

A key deliverable is that the wizard creates a controlled, standardized payload that Averdi (or a partner) can rely on.

There’s also a demo/preview layer:

HTML preview is served from a route: GET()

The preview HTML is a full “verify/edit then send” interface:

“Verify and edit integration settings”: ExampleOfJson.html

“Send to integration partner”: ExampleOfJson.html

“Summary before sending”: ExampleOfJson.html

This achieves the goal described:

Averdi controls what is collected (structured wizard)

Averdi controls what is shared (review + explicit send)

Partners receive clean, consistent data, reducing back-and-forth and “client guiding” on repetitive setup tasks.

6.5 Embedded step-by-step guides reduce support load

The wizard includes expandable guides for:

Vipps portal credentials, with partner-specific flow (e.g., eMonkey) and responsive images:
VippsCredentialsGuide()
Accounting system API/OAuth steps: AccountingCredentialsGuide()
This is operationally significant: the “guide” is now software + UX, not tribal knowledge.

6.6 Mermaid: data flow and handover
collects org+modules+keys

approved subset

support handoff

Client user

Vipps wizard UI

Standard config object

Download JSON config

Download TXT implementation guide

Preview/Edit page

Integration partner

Averdi support

7) Platform/tech + design (site-wide)

7.1 Modern Next.js + App Router

App-wide layout with shared navigation and footer: RootLayout()

Next.js config tuned for build tracing + external packages: nextConfig

7.2 Design system choices

Tailwind brand colors defined centrally: tailwind.config.js

Component-level motion for interactive UX: dependency set in package.json

7.3 Trust and credibility signals (important for YMYL)

Persistent company information + regulatory trust claims: Footer()

Navigation architecture ensures knowledge pages are reachable and internally linked: Navbar()

8) What this enables next (strategic roadmap)

Turn the expert registry into real profile pages (e.g. /eksperter/[id]) using experts as the source.
Add consistent Article schema to all long-form articles and unify author identity to the same expert IDs.

Expand the Vipps wizard pattern to other products (new partners/modules) by extending modules and reusing VippsSetupWizard().

Add validation/telemetry around the machine-readable data attributes from `McpDataSpan()` for compliance-grade numbers.
